From: Gregory S. Douglas, Ph.D. (NewFields)

Date: August 28, 2023

Subject: Chemical Fingerprinting of samples collected in Ventanilla, Peru

This memorandum summarizes the results of forensic chemical analysis conducted on four (4) samples that were collected by Repsol contractors on August 1, 2023 (Table 1). The samples were shipped to NewFields alliance laboratory, Alpha Analytical Laboratory, Inc. (Mansfield MA) for forensic chemical analysis. The objective of the analysis was to the degree possible, identify the product type (s) present in each sample and determine if the chemical composition is similar between the four samples and if they were derived from the same or a different source of petroleum.

Sample and Analysis

Samples of suspected petroleum were collected by Repsol contractors in amber glass bottles consisting of petroleum residues. Samples HC DEL 01AGO2023, GE DEL 01AGO2023, GE CAV 01AGO2023, and HC-DEL 01AGO2023 were shipped to Alpha Analytical Labs in Mansfield, MA under chain of custody (Attachment 1) and arrived at ambient temperature (21.7°C) on August 7, 2023 with a DHL Tracking # 3425612050 (Seal numbers 200982, 201650, 201649, and 201670 respectively).

Samples were extracted using methylene chloride and diluted to volume. A portion of the extract was removed for gravimetric weight determination. A portion of the extract was removed (based on the gravimetric weight), spiked with surrogates and internal standards, and analyzed following laboratory methods that were specifically developed for forensic characterization of petroleum, as described by Douglas et.al. (2015).¹

- The samples were analyzed using a modified EPA Method 8015 gas chromatography/flame ionization detection (GC/FID) technique to generate a high resolution chromatographic “fingerprint” of hydrocarbons present in the sample. The chromatographic “fingerprint” identifies the general nature of the hydrocarbons (e.g., petroleum product type) and relative weathering state of the sample. A suite of normal and branched-chain alkanes as well as total petroleum hydrocarbons (TPH) were also measured to aid in product identification (Table 2). Sample results were reported on a mg/kg (oils) basis.
- The samples were also analyzed by a modified EPA Method 8270 gas chromatography/mass spectrometry (GC/MS) method operated in the selected ion monitoring (SIM) mode to quantify concentrations of 62 oil source diagnostic parent and C1-C4 alkylated PAHs (Table 3), and 55 sterane and triterpane petroleum biomarkers compounds (Table 4). These compounds provide highly specific information pertinent to the identification of petroleum or pyrogenic PAHs and their potential origin. Sample results were reported on a mg/kg (oils) basis.

¹ Douglas, G.D., Emsbo-Mattingly, S.D., Stout, S.A., Uhler, A.D., and McCarthy, K.J. (2015). Hydrocarbon fingerprinting methods. In: Introduction to Environmental Forensics, 3rd Ed., B. Murphy and R. Morrison, Eds., Academic Press, New York, pp. 201-310.

All chemical analyses were conducted following standard EPA methods for laboratory documentation, sample handling, instrument calibration, and method quality control. Quantified sample results are included in Attachment 2.

Findings

The gas chromatographic “fingerprints” of HC DEL 01AGO2023 (HC DEL1), GE DEL 01AGO2023 (GE DEL1), GE CAV 01AGO2023 (GE CAV1), and HC-DEL 01AGO2023 (HC-DEL1) are shown in Figures 1A - 1D respectively.

GC/FID Analysis

The GC/FID chromatogram for HC DEL1, GE DEL1 and HC CAV1 (Figure 1A – 1C), shows all three samples contain a broad C₁₅ – C₄₄ range material consisting of resolved n-alkanes and an unresolved complex mixture (UCM) which appears as a “hump” in the chromatogram. These samples are slightly/moderately weathered due to evaporation and biodegradation as indicated by the absence of the more volatile alkanes (C₈ -C₁₄). Sample

HC-DEL1 (Figure 1D) is similar to the three samples listed above although this sample is slightly less weathered as evident by the presence of the lighter alkane C₁₃. In addition, sample HC-DEL1 also contains what appears to be a non-petroleum component that can be seen as a large broad peak just before C₂₂ as well as some smaller peaks in the C₃₀ range (Figure 1D). Inspection of the sample detected the presence of leaves, sticks, and small pieces of what appears to be plastic material which may explain the non-petroleum component observed in the chromatogram.

There is a noticeable similarity in the pristane/phytane source ratio between all four samples. The slight difference noted in samples GE DEL1 (Figure 1B) and GE CAV1 (Figure 1C) is likely due to weathering. The petroleum GC/FID signature is consistent with a slightly/moderately weathered crude or heavy fuel oil.

GC/MS Alkylated PAH and Biomarker Analysis

The PAH and biomarker molecular chemistry was evaluated to determine if there was evidence for a chemical linkage between the four samples. GC/MS analysis of PAH and biomarker compounds is approximately 10 times more sensitive than the GC/FID analysis and provides source diagnostic weathering resistant chromatographic “fingerprints” of the samples.

Qualitative comparison of the PAH histograms for the four samples are provided in Figures 2A – 2D respectively. The PAH histograms are all similar and show the samples are slightly/moderately weathered as indicated by the lower abundance of decalins and naphthalenes compared to phenanthrenes. The proportion of alkylated dibenzothiophenes and naphthobenzothiophenes to phenanthrenes (Figure 2B) indicates the presence of a higher sulfur fuel in all four samples.

Figure 3 is a double source ratio plot of sulfur containing alkyl-dibenzothiophenes to alkyl-phenanthrenes (C₂-dibenzothiophenes/C₂-phenanthrenes [D₂/P₂] versus C₃-dibenzothiophenes/C₃-phenanthrenes [D₃/P₃]). Differences in this ratio are a function of crude oil source and refinery processing.² All four samples plot close to each other indicating a common source of petroleum.

² Douglas, G.S. et al. (1996) Environmental stability of selected petroleum hydrocarbon source and weathering ratios. Environ. Sci. Technol. 30: 2332-2339.

The biomarker triterpene m/z 191 ion traces for the four samples are presented in Figures 4A - 4D respectively. The biomarker traces for all four samples are essentially identical and indicate all four samples were derived from the same source of petroleum.

Figure 5 is a double source ratio plot for the biomarkers norhopane/hopane versus TS/TM. Differences in these ratio plots are a function of crude oil source and refinery processing.^{Error!} **Bookmark not defined.** The four field samples plot next to each other indicating a common oil source.

The triaromatic steroid m/z 231 ion traces for the four samples are presented in Figures 6A - 6D respectively and also indicate a petroleum source relationship in all four samples.

Conclusion

Samples HC DEL 01AGO2023, GE DEL 01AGO2023, GE CAV 01AGO2023, and HC-DEL 01AGO2023 consist of a slightly/moderately weathered crude oil or heavy fuel oil. The FID, PAH and biomarker analysis indicates the petroleum detected in the four field samples chemically match and were derived from the same source of petroleum.

List of Potential Qualifiers

- A: Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.
- B: The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C: Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D: Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E: Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- F: The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum.
- G: The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H: The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I: The lower value for the two columns has been reported due to obvious interference.
- J: Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs). For calculated parameters, this represents that one or more values used in the calculation were estimated.
- J: Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- J: Estimated value. The Target analyte concentration is below the Limit of Quantitation (LOQ), but above the Detection Limit (DL). This represents an estimated concentration for Tentatively Identified Compounds (TICs). For calculated parameters, this represents that one or more values used in the calculation were estimated.
- M: Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- ND: Not detected at the Limit of Quantitation (LOQ) for the sample.
- ND: Not detected at the Limit of Detection (LOD) for the sample.
- ND: Not detected at the reporting limit (RL) for the sample.
- ND: Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.
- NJ: Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P: The RPD between the results for the two columns exceeds the method-specified criteria.
- Q: The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R: Analytical results are from sample re-analysis.
- RE: Analytical results are from sample re-extraction.
- S: Analytical results are from modified screening analysis.
- U: Not detected at the reported detection limit for the sample.
- V: The surrogate associated with this target analyte has a recovery outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)
- Z: The batch matrix spike and/or duplicate associated with this target analyte has a recovery/RPD outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)
